

Image-based Lighting (Part 2)

T2

Computational Photography
Derek Hoiem, University of Illinois

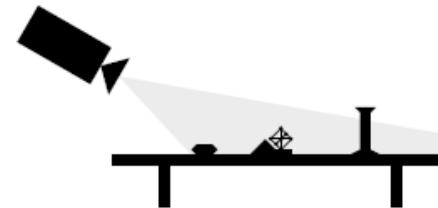

Today

- Brief review of last class
- Show how to get an HDR image from several LDR images, and how to display HDR
- Show how to insert fake objects into real scenes using environment maps

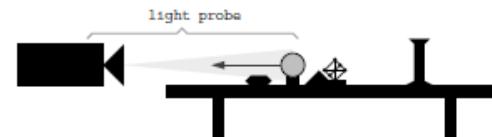

How to render an object inserted into an image?

Image-based lighting

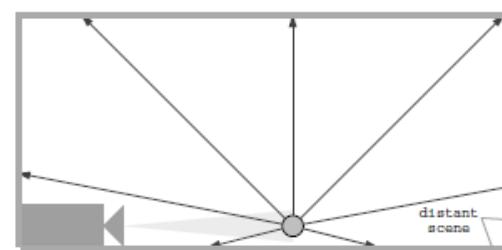

- Capture incoming light with a “light probe”
- Model local scene
- Ray trace, but replace distant scene with info from light probe

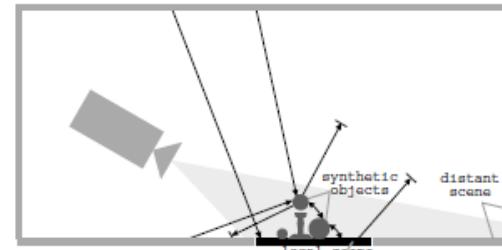

(a) Acquiring the background photograph

(b) Using the light probe

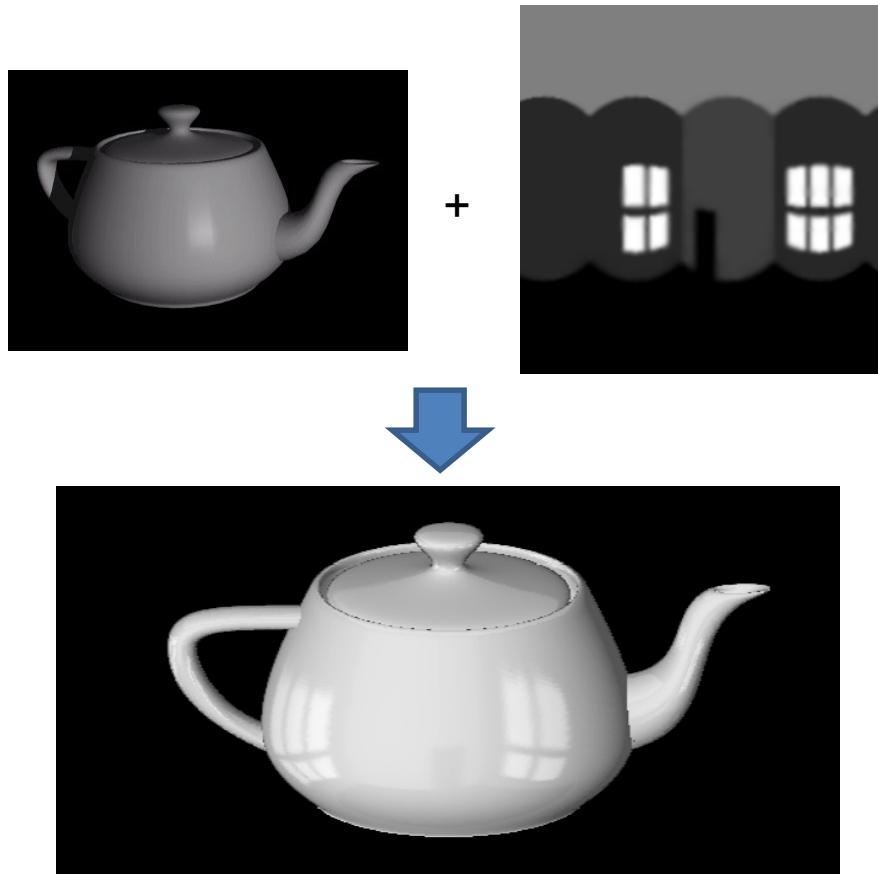

(c) Constructing the light-based model

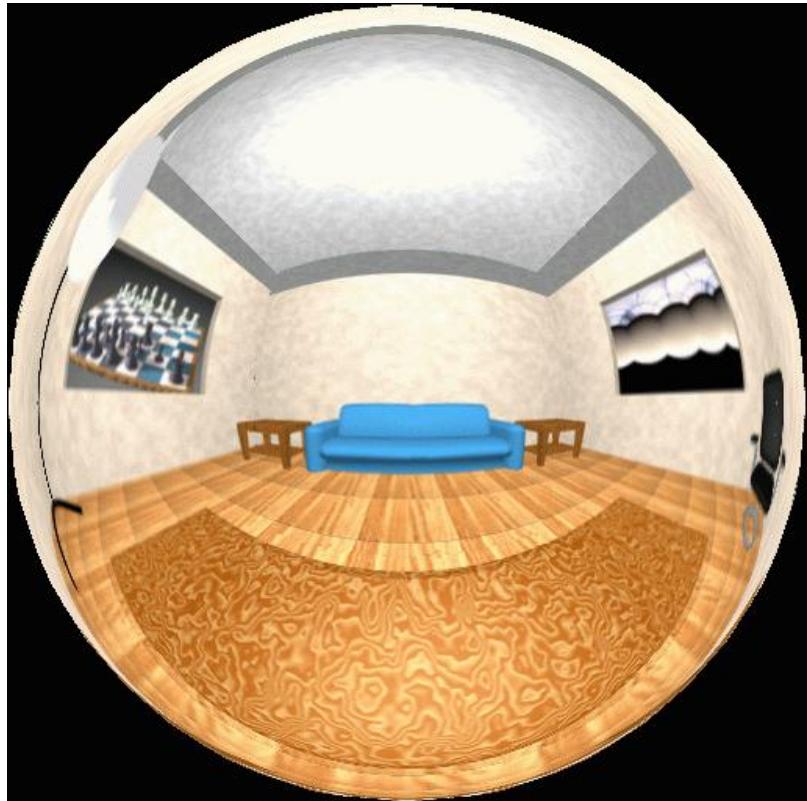

(d) Computing the global illumination solution

Key ideas for Image-based Lighting

- Environment maps: tell what light is entering at each angle within some shell

Spherical Map Example

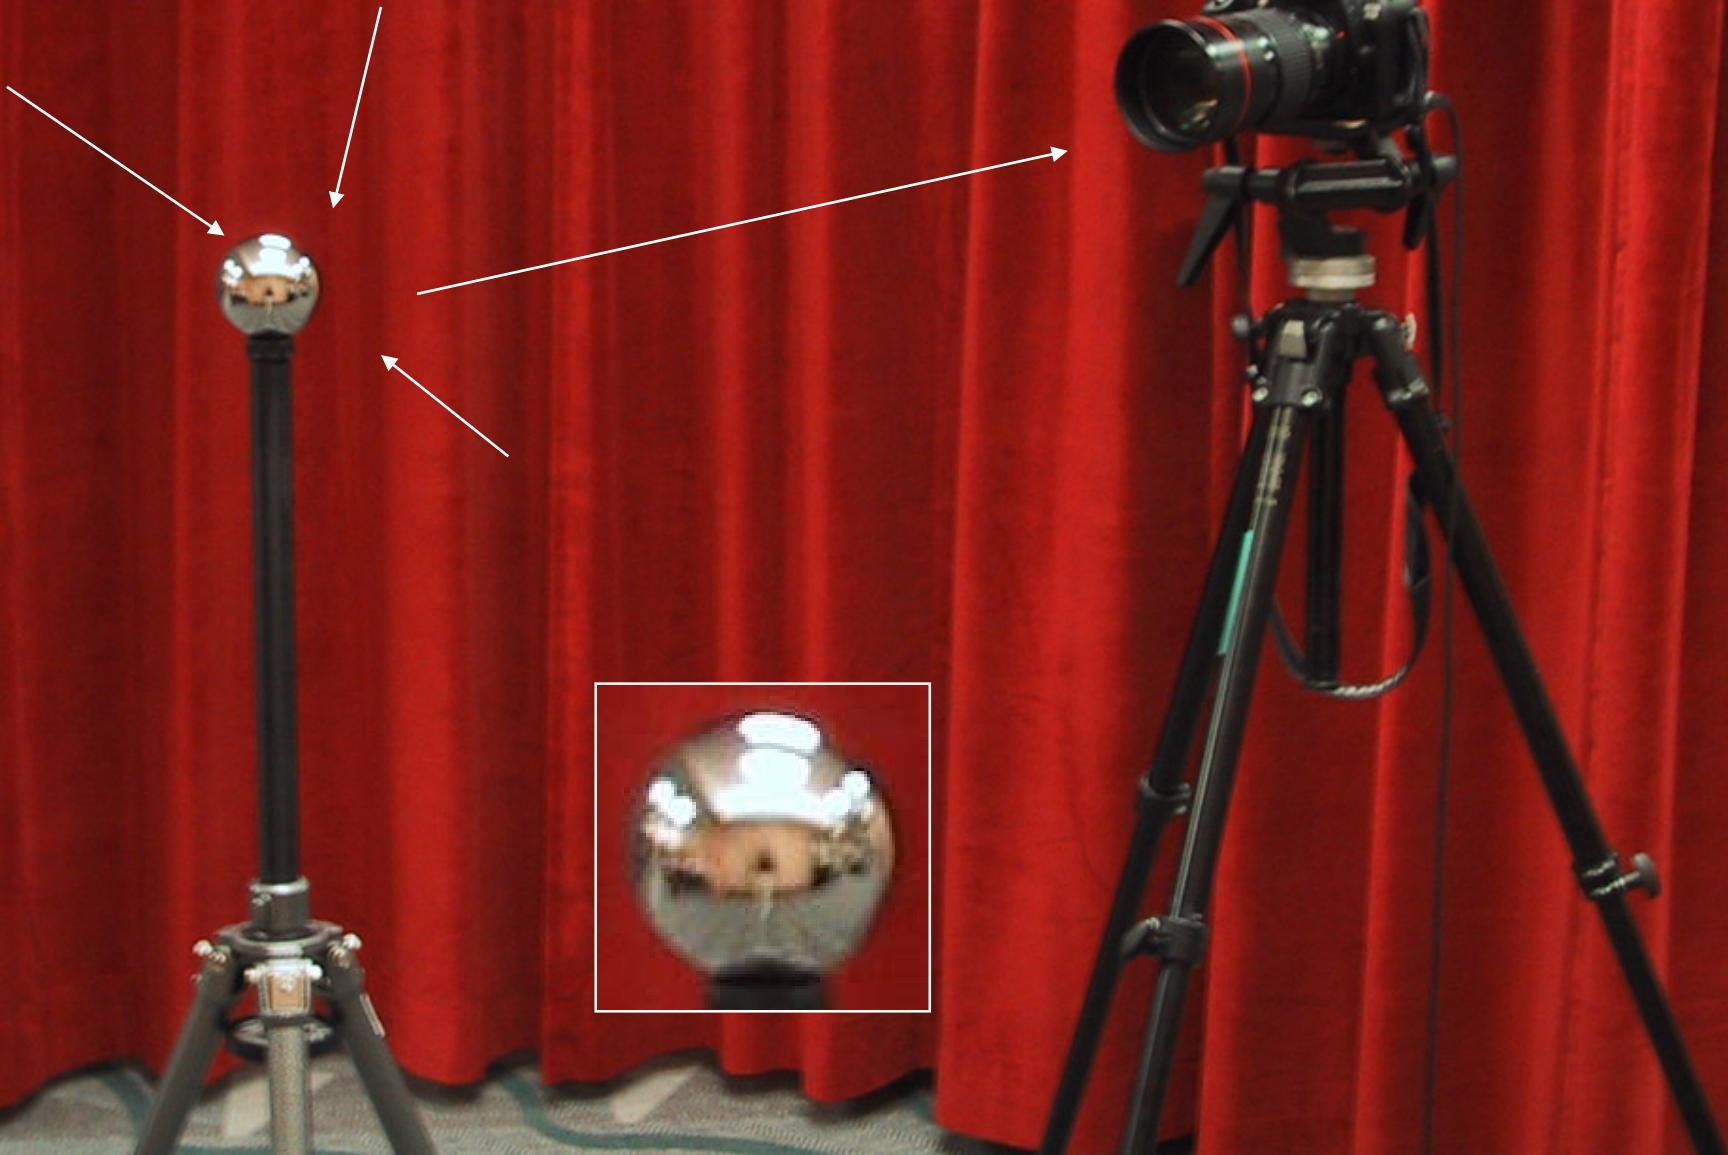

Key ideas for Image-based Lighting

- Light probes: a way of capturing environment maps in real scenes

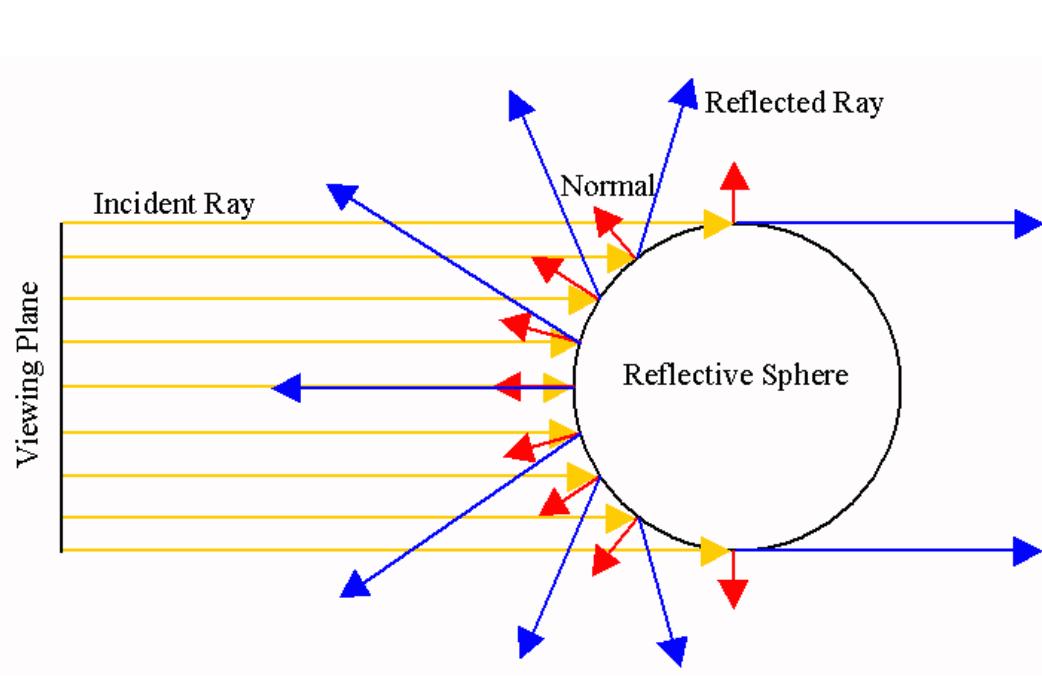

Mirrored Sphere

One picture of a mirrored ball received light coming into the ball from nearly all angles (including behind)

Assume camera is roughly same height as light probe and is sufficiently distant, so all viewing rays that hit light probe are roughly in direction of z-axis

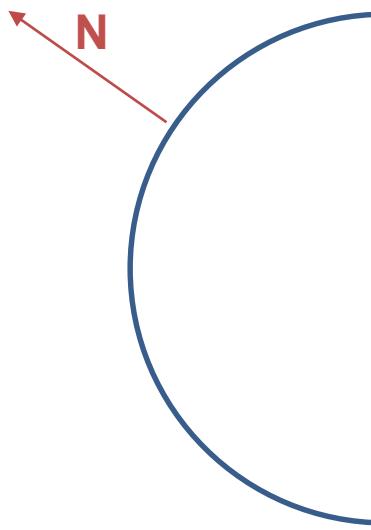

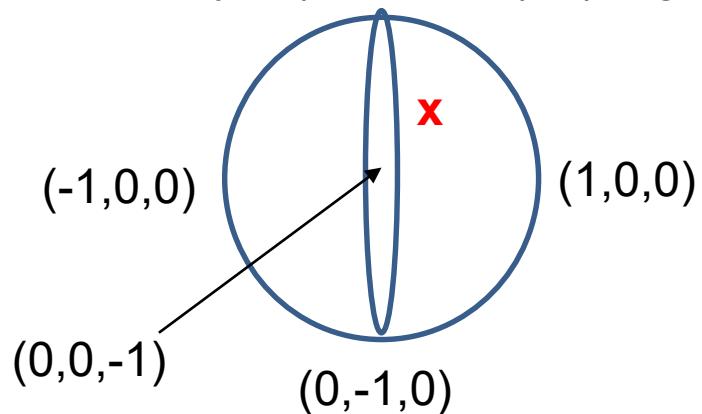

Solving for normal vector

$(u, v) \rightarrow (Nx, Ny, Nz)?$

$$Nx = (u - \text{center}) / (\text{width}/2)$$

$$Ny = (v - \text{center}) / (\text{height}/2)$$

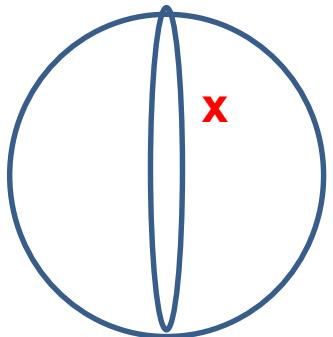

$$Nx^2 + Ny^2 + Nz^2 = 1$$

Solving for reflection vector

$$(u, v) \rightarrow (N_x, N_y, N_z)$$

$$\begin{aligned} \text{dot}(-\mathbf{V}, \mathbf{N})^* \mathbf{N} & \quad \mathbf{R} = -\mathbf{V} + 2 * (\text{dot}(-\mathbf{V}, \mathbf{N})^* \mathbf{N} - (-\mathbf{V})) \\ & = \mathbf{V} - 2 * \text{dot}(\mathbf{V}, \mathbf{N})^* \mathbf{N} \\ \mathbf{V} = [0 \ 0 \ 1] \end{aligned}$$
A geometric diagram illustrating the calculation of a reflection vector. It shows a sphere on the right with a blue vector \mathbf{V} originating from its surface. A red vector \mathbf{N} represents the surface normal at that point. A green vector \mathbf{R} represents the reflected vector. A blue arrow points from the text "dot(- \mathbf{V} , \mathbf{N})* \mathbf{N} " to the red vector \mathbf{N} . Above the diagram, the reflection formula is derived:
$$\begin{aligned} \mathbf{R} &= -\mathbf{V} + 2 * (\text{dot}(-\mathbf{V}, \mathbf{N})^* \mathbf{N} - (-\mathbf{V})) \\ &= \mathbf{V} - 2 * \text{dot}(\mathbf{V}, \mathbf{N})^* \mathbf{N} \end{aligned}$$
 Below the diagram, the vector $\mathbf{V} = [0 \ 0 \ 1]$ is given.

One small snag

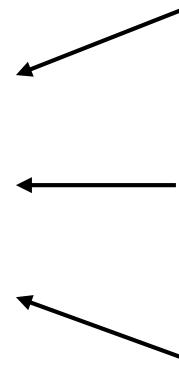

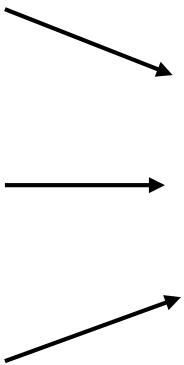

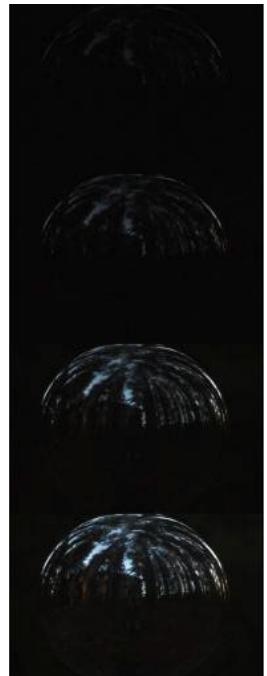

- How do we deal with light sources? Sun, lights, etc?
 - They are much, much brighter than the rest of the environment

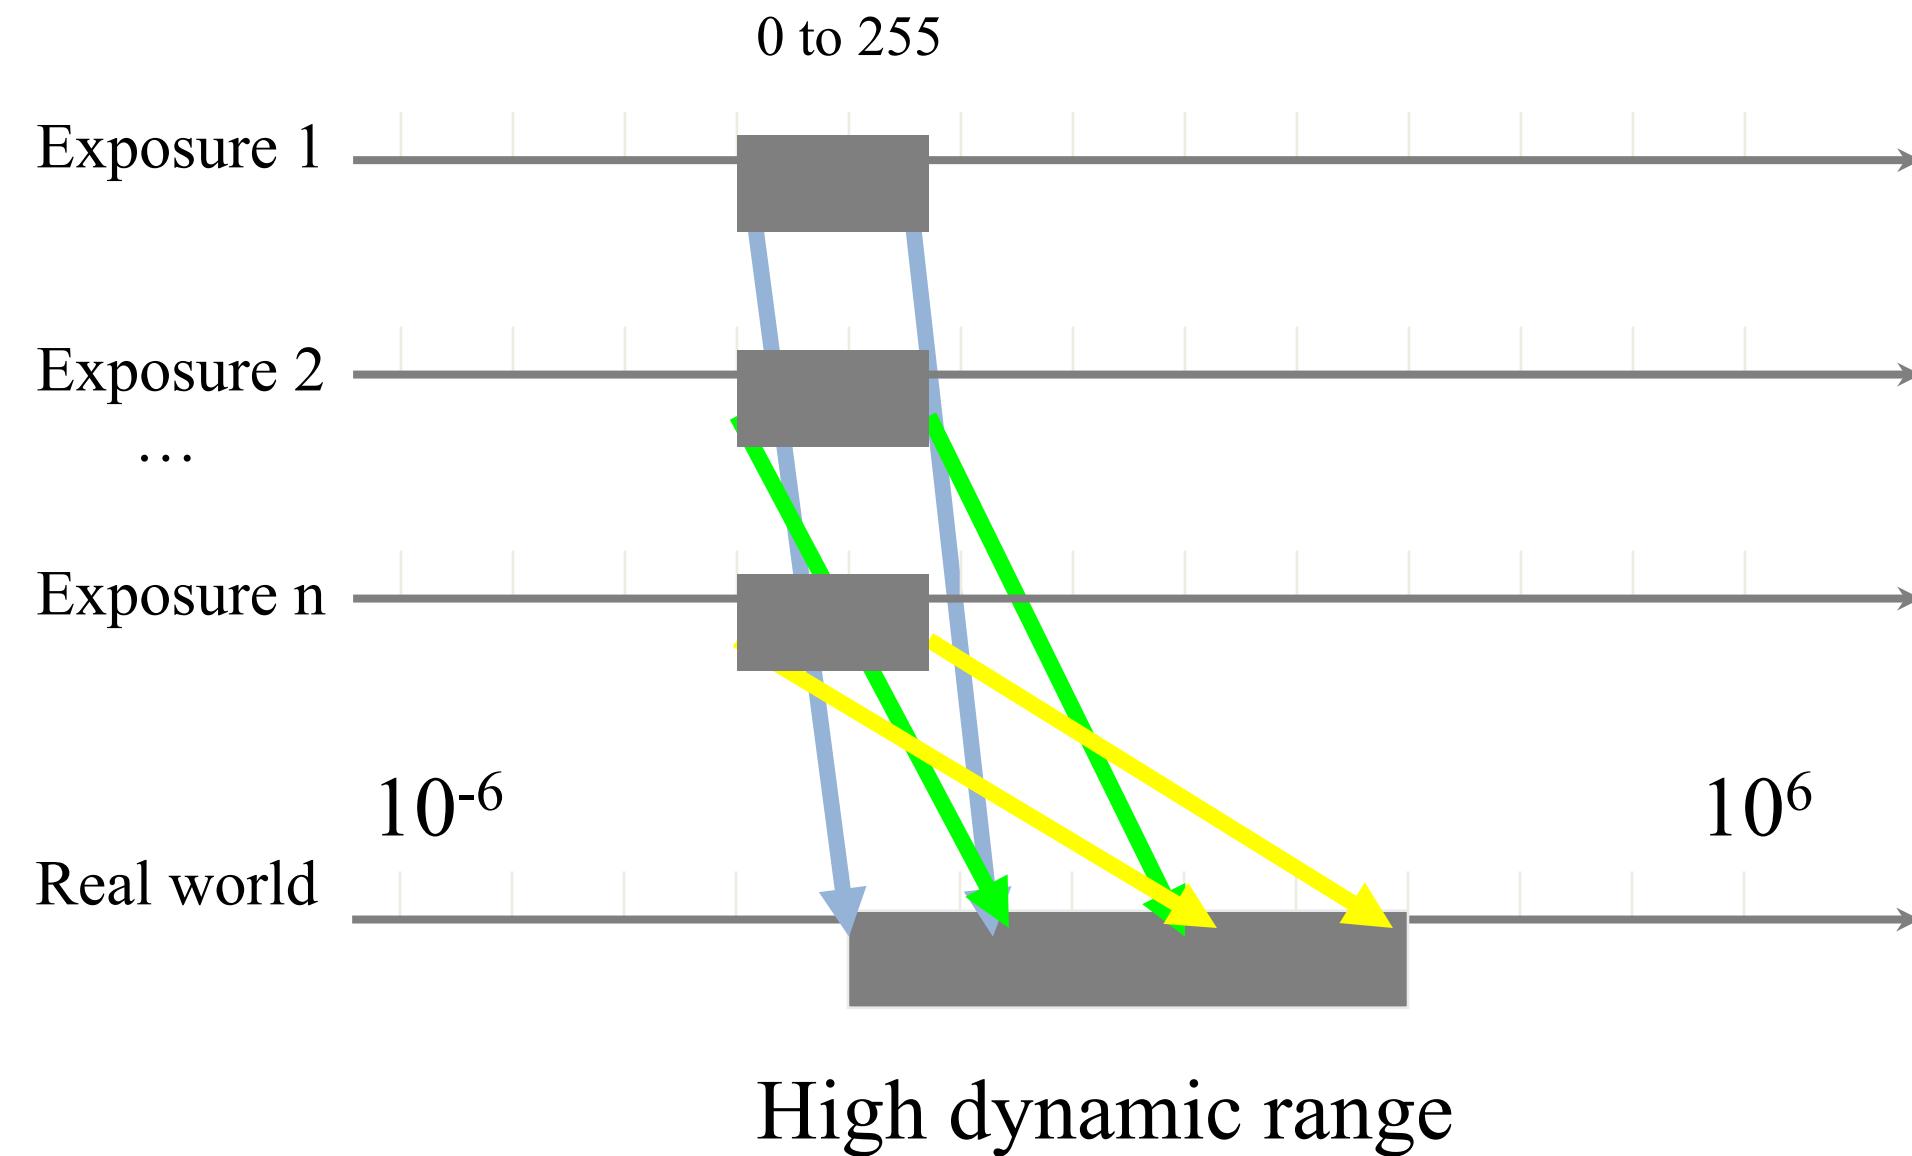

- Use High Dynamic Range photography!

Key ideas for Image-based Lighting

- Capturing HDR images: needed so that light probes capture full range of radiance

LDR->HDR by merging exposures

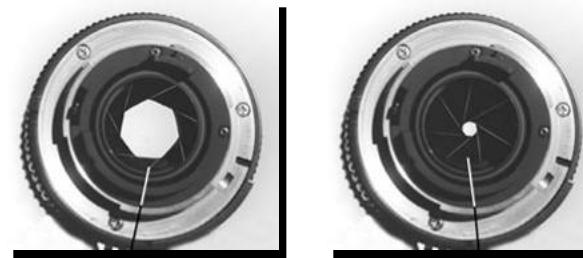

Ways to vary exposure

Shutter Speed

F/stop (aperture, iris)

Neutral Density (ND) Filters

Recovering High Dynamic Range Radiance Maps from Photographs

Paul E. Debevec

Jitendra Malik

University of California at Berkeley¹

SIGGRAPH 1997

The Approach

- Get pixel values Z_{ij} for image with shutter time Δt_j (i^{th} pixel location, j^{th} image)
- Exposure is irradiance integrated over time:

$$E_{ij} = R_i \cdot \Delta t_j$$

- Pixel values are non-linearly mapped E_{ij} 's:

$$Z_{ij} = f(E_{ij}) = f(R_i \cdot \Delta t_j)$$

- Rewrite to form a (not so obvious) linear system:

$$\ln f^{-1}(Z_{ij}) = \ln(R_i) + \ln(\Delta t_j)$$

$$g(Z_{ij}) = \ln(R_i) + \ln(\Delta t_j)$$

The objective

Solve for radiance R and mapping g for each of 256 pixel values to minimize:

$$\sum_{i=1}^N \sum_{j=1}^P w(Z_{ij}) [\ln R_i + \ln \Delta t_j - g(Z_{ij})]^2 + \lambda \sum_{z=Z_{min}}^{Z_{max}} w(z) g''(z)^2$$

give pixels near 0 or 255 less weight

known shutter time for image j

exposure should smoothly increase as pixel intensity increases

irradiance at particular pixel site is the same for each image

exposure, as a function of pixel value

Matlab Code

```
%  
% gsolve.m - Solve for imaging system response function  
%  
% Given a set of pixel values observed for several pixels in several  
% images with different exposure times, this function returns the  
% imaging system's response function g as well as the log film irradiance  
% values for the observed pixels.  
%  
% Assumes:  
%  
% Zmin = 0  
% Zmax = 255  
%  
% Arguments:  
%  
% Z(i,j) is the pixel values of pixel location number i in image j  
% B(j) is the log delta t, or log shutter speed, for image j  
% l is lambda, the constant that determines the amount of smoothness  
% w(z) is the weighting function value for pixel value z  
%  
% Returns:  
%  
% g(z) is the log exposure corresponding to pixel value z  
% lE(i) is the log film irradiance at pixel location i  
%  
function [g,lE]=gsolve(Z,B,l,w)  
n = 256;  
  
A = zeros(size(Z,1)*size(Z,2)+n+1,n+size(Z,1));  
b = zeros(size(A,1),1);  
  
%% Include the data-fitting equations  
  
k = 1;  
for i=1:size(Z,1)  
    for j=1:size(Z,2)  
        wij = w(Z(i,j)+1);  
        A(k,Z(i,j)+1) = wij; A(k,n+i) = -wij; b(k,1) = wij * B(i,j);  
        k=k+1;  
    end  
end  
  
%% Fix the curve by setting its middle value to 0  
  
A(k,129) = 1;  
k=k+1;  
  
%% Include the smoothness equations  
  
for i=1:n-2  
    A(k,i)-l*w(i+1); A(k,i+1)=-2*l*w(i+1); A(k,i+2)=l*w(i+1);  
    k=k+1;  
end  
  
%% Solve the system using SVD  
  
x = A\b;  
  
g = x(1:n);  
lE = x(n+1:size(x,1));
```

Matlab Code

```
function [g,lE]=gsolve(Z,B,l,w)

n = 256;
A = zeros(size(Z,1)*size(Z,2)+n+1,n+size(Z,1));
b = zeros(size(A,1),1);

k = 1; % Include the data-fitting equations
for i=1:size(Z,1)
    for j=1:size(Z,2)
        wij = w(Z(i,j)+1);
        A(k,Z(i,j)+1) = wij; A(k,n+i) = -wij; b(k,1) = wij * B(j);
        k=k+1;
    end
end

for i=1:n-2 % Include the smoothness equations
    A(k,i)=l*w(i+1); A(k,i+1)=-2*l*w(i+1); A(k,i+2)=l*w(i+1);
    k=k+1;
end

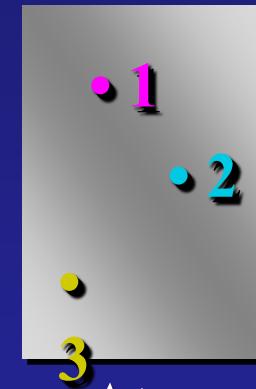

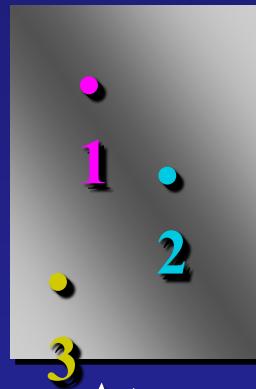

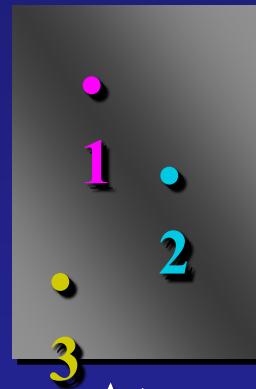

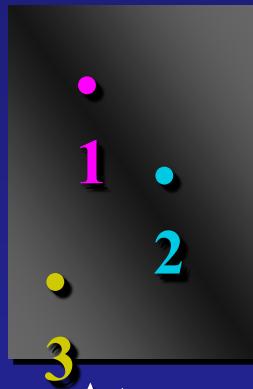

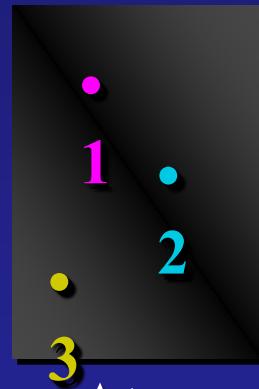

A(k,129) = 1; % Fix the curve by setting its middle value to 0
k=k+1;

x = A\b; % Solve the system using pseudoinverse

g = x(1:n);
lE = x(n+1:size(x,1));
```

Summary

- Real scenes have complex geometries and materials that are difficult to model
- We can use an environment map, captured with a light probe, as a replacement for distance lighting
- We can get an HDR image by combining bracketed shots
- We can relight objects at that position using the environment map
